
Investigators examine results of A321 wreckage surface layout

A team of the central office of the Investigative Committee has examined a surface layout of the A321 plane wreckage at the Cairo airport.

During the examination the investigators identified and registered the places where the blast ripped through the fuselage as well as the areas of subsequent damage. The results of the examination have been given to a commission of experts who are now running comprehensive forensic inquiry to establish the details of the crime.

The examination is the first example of independent criminal procedural operations carried out by Russian investigative authorities abroad based on the provisions of the RF Criminal Procedure Code introduced by the Federal Law of 6 July 2016 No 375-FZ “On amendments to the RF Criminal Code and Criminal Procedure Code regarding introduction of additional counter-terrorism measures and ensuring public safety.”

At present the team of Russian investigators continue investigative operations in Egypt.
